

Lab 04 Report + Screen Shots

Jack Kane

This lab highlighted the importance of covering all tests and how it should be done with as little tests as possible, for example in this lab, ensuring node coverage will also ensure full edge coverage making it so you do not need to create extra tests for edge coverage although this may not apply for all graphs.

It is also best to cover your prime paths by going from the largest to smallest as this will result in the least number of tests as often the larger ones contain the smaller prime paths inside of them allowing you to cover all prime paths efficiently

It is best to achieve all coverage by using the least amount of tests to reduce overhead cost.

```
29 TEST(ScanRegion, NodeCoverage_SecondTest) {
30     EXPECT_EQ(scanRegion(g), -7); //1 -> 2 -> 3 -> 4 -> 5 -> 4 -> 6 -> 2 -> 7 -> 9 -> 10 -> 12 -> 13 : P01, P03, P22
31     g = {{12}};
32     EXPECT_EQ(scanRegion(g), 12); //1 -> 2 -> 3 -> 4 -> 5 -> 4 -> 6 -> 2 -> 7 -> 8 -> 10 -> 11 -> 13 :
33 }
34
35 // TODO(Task 3 - edge coverage): add the tests that cover the edges node
36 // coverage leaves out. The edge from the outer loop test straight to the code
37 // after the loops needs a grid the outer loop never enters.
38 TEST(ScanRegion, EdgeCoverage_EmptyRegion) {
39     //FAIL() << "not implemented"; //edge coverage achieved from previous tests
40 }
41
42 // TODO(Task 4 - prime path tour): using the prime path list in the overview,
43 // add tests whose executions tour the feasible prime paths. Label each test
44 // with the prime path numbers it covers. Three of the listed prime paths are
45 // infeasible; you do not write tests for those, but you must explain in your
46 // report why they cannot be toured.
47 TEST(ScanRegion, PrimePath_Example) {
